
INTERVIEW THESIS BRIEF

RELIABILITY SHOULD LEARN UNDER LOAD.

The role is designed to convert fragmented maintenance practices, systems, and data into a reusable enterprise product system that improves uptime, maintenance effectiveness, spare-parts economics, and decision quality.

CANDIDATE THESIS

Reliability scales when every maintenance event strengthens the next decision.

THE BRIEF

- 01 Actual mandate
- 02 Operating tensions
- 03 Evidence map
- 04 Hard objection
- 05 Executive questions

ACTUAL MANDATE

Convert maintenance and reliability from fragmented local practices, systems, and data into a reusable enterprise product system that improves uptime, maintenance effectiveness, spare-parts economics, and decision quality.

FIVE TENSIONS TO MANAGE

- 01 ENTERPRISE STANDARD VS LOCAL ASSET REALITY**
Preserve plant judgment without multiplying process, data, integration, and support variants.
- 02 NEAR-TERM UPTIME VS LONG-TERM ARCHITECTURE**
Deliver immediate value without creating another generation of point solutions.
- 03 DATA GOVERNANCE VS WORK USABILITY**
Make trusted capture part of planning, execution, closure, and learning.
- 04 INVENTORY RESILIENCE VS WORKING CAPITAL**
Link stocking logic to consequence, lead time, substitution, and service risk.
- 05 AI AMBITION VS ACTION READINESS**
Use AI only where signals can change bounded work with clear human authority.

RELIABILITY GRAIN MAP | SIX CONNECTED DOMAINS

- | | |
|---|---|
| 01 Asset context and criticality | 04 Failure learning and uncertainty |
| 02 Condition evidence and confidence | 05 Materials resilience and substitution |
| 03 Work authority and response | 06 Strategy change and verification |

Architecture and governance earn their place when they make a decision more dependable, a workflow easier, a pattern reusable, or a result easier to verify.

EVIDENCE MAP

COMPUNETICS

Engineering, manufacturing, quality, root cause, process controls, and high-consequence programs.

AMAZON

24/7 execution, planning, standard work, throughput visibility, escalation, Lean and Gemba.

VAPE-JET

Production, purchasing, quality, ERP/Odoo, support, telemetry, and approximately 1,000 fielded robots.

DUDEWORTH

Digital product framing, AI readiness, human authority, evaluation, governance, adoption, and reuse.

HARD OBJECTION

CONCERN

No direct SAP PM ownership or formal reliability title.

RESPONSE

State the gap plainly. Pair with Carpenter's reliability and SAP experts. Contribute the cross-system integration this role requires: high-reliability operations, quality and root-cause mechanisms, ERP workflow transformation, machine signals, digital product thinking, AI governance, and adoption.

DECISION RIGHTS TO CLARIFY

- Enterprise standard vs site variation
- Use-case funding and stopping rules
- Data ownership and quality accountability
- Build, buy, configure, or retire
- Human authority over AI recommendations

EXECUTIVE INTERVIEW QUESTIONS

- 01 Which availability losses have enterprise leverage rather than only local leverage?
- 02 Where is the greatest break between work execution and failure learning?
- 03 What is the intended balance between SAP PM standardization and surrounding digital products?
- 04 Which site or asset class is the best proving ground for a closed-loop reliability product?
- 05 How will value be judged across uptime, work quality, data quality, inventory, adoption, and reuse?
- 06 Which AI decisions may be recommended, and which must remain explicitly human?
