

120-DAY ENTRY PLAN

LEARN THE SYSTEM. PROVE ONE LOOP. SCALE THE PATTERN.

The first four months should establish credibility without pretending the platform choice is already known.

ENTRY PRINCIPLE

Begin with one consequential, measurable reliability decision. Do not begin with an enterprise technology rollout.

FOUR PHASES

- 01 Read the system
- 02 Frame the product
- 03 Prove one closed loop
- 04 Scale the pattern

DAYS 1-30 | READ THE SYSTEM

LISTEN & OBSERVE

- Executive objectives and capacity economics
- Reliability practices and legitimate site variation
- Planner, scheduler, technician, operator, supply-chain, and data workflows
- SAP PM/CMMS object model, integrations, and workarounds
- Asset hierarchy, criticality, failure taxonomy, work closure, and MRO linkage

MAP THE DECISIONS

- What gets worked now?
- What gets deferred?
- What becomes a PM change?
- What changes a stocking strategy?
- What escalates to engineering or capital?

DELIVERABLES

- Reliability product charter
- Stakeholder and decision-rights map
- System and data landscape
- Top reliability decision frictions
- Baseline measurement plan
- Use-case selection criteria

EXIT CRITERIA

- Problem boundary is agreed
- Executive sponsor and frontline product owner are clear
- Current state is documented without blame
- No platform decision substitutes for problem definition

DAYS 31-60 | FRAME THE PRODUCT

PRODUCT	Vision, outcomes, personas, roadmap, backlog, stopping rules	What earns attention and funding?
DATA	Minimum reliability data contract and ownership	What must be trusted and reused?
ARCHITECTURE	Integration pattern and build/buy constraints	What belongs in SAP, platform, service, or workflow?
ADOPTION	Workflow and behavior-change plan	What must users do differently?
ECONOMICS	Baseline categories and evidence plan	How will value and burden be judged?

DAYS 61-90 | PROVE ONE CLOSED LOOP

Select a use case with meaningful consequence, observable recurrence or burden, enough data to learn, a clear action path, and a frontline owner. Candidate examples include recurring failure elimination, condition-to-work routing, PM optimization, or critical-spare linkage.

WORK CHANGED	Planning, scheduling, execution, closure, escalation, or stocking decision changed.
DATA IMPROVED	The workflow produced more complete, timely, owned, reusable evidence.
USER ADOPTED	Users understood the recommendation, used or overrode it, and could explain why.
OUTCOME OBSERVED	Availability, recurrence, work quality, inventory risk, or decision latency could be compared with baseline.
PATTERN REUSABLE	The capability can transfer across assets or sites without copying local exceptions blindly.

DAYS 91-120 | SCALE THE PATTERN

INSTITUTIONALIZE

- Product operating cadence and backlog governance
- Data-product owners and quality accountabilities
- Architecture and integration guardrails
- AI authority, evaluation, override, and learning controls
- Site adoption playbook and local-variation rules

PORTFOLIO DECISIONS

- Scale: repeatable value and adoption
- Adapt: value with legitimate site variation
- Hold: action or evidence not ready
- Buy/configure: commodity capability
- Build: differentiated workflow or integration
- Stop: burden exceeds likely value

120-DAY SUCCESS

An agreed product architecture, one credible closed-loop proof, visible measurement discipline, and a reusable way to decide what scales next.
